

# Leopard 10.5.8 latest software

Here is a list of the latest software that OS X Leopard supports. If you have software that can be added, tell me in the thread and where to find it, so we can expand the list. A lot of the software is not on the mac repository sites or other sites, some download links are broken and programs or any info about them will be extremely hard to find. I have a lot of free space on my HDD and I store all this software & can send a download link whenever someone needs something (ideal solution is if we can make a file server or make a new updated PCC store). I first used a list from "The Leopard Thread", sorted everything better (sorry if something isn't in order) and added programs that weren't there before. Also, some of the programs weren't the latest version, so I found the latest, found a serial and added it in the folder. Please, if you want to add something on the list, check if it truly is the latest version for PPC! Also, if some program is put under incorrect label or there is a better version, please tell me in the thread, i want to make it as best as possible!

Green	Have latest version of the software and a working serial if it needs one
Blue	Have latest version of the software, but no serial
Red	Downloaded latest version of the software, but haven't tested it
Magenta	I guess that this is the latest version, but can't find a download link anywhere
Black	Not downloaded or checked if it works or latest version

**Bold Black** - made a list like this before without checking too much if the programs were latest version & these weren't on the Leopard Thread list, so i copied them & need to check again
